

RSL Cards Mobile App Front-End Review

Phase 1 Structure and Functionality Recommendation

Prepared for: Pavan and the RSL Cards Development Team

Prepared by: Harris Lane

Date: July 15, 2026

Review type: Front-end design, mobile information architecture, cross-platform consistency, and Phase 1 functionality review

1. Review Purpose and Scope

This report documents the initial consolidated front-end review of the RSL Cards mobile application in its current development state. The review focuses on screen purpose, navigation, information hierarchy, terminology, visual consistency, and the minimum functionality required for a dependable Phase 1 release.

The application is not being evaluated as a completed technical product. It is understood that backend connections, marketplace integrations, calculations, and certain workflows remain under development. The recommendations below are intended to reduce unnecessary complexity, prevent unsupported product promises, and establish a focused mobile experience that can function reliably during real dealer activity.

2. Overall Recommendation

The mobile application has a strong dark visual foundation and an appropriate dealer-focused direction. However, the current version includes several additional analytics, AI, menu, and utility elements that compete with the application's primary purpose.

The app should be positioned as a streamlined extension of the dealer dashboard rather than a separate product. Its principal role is to help a dealer record activity quickly while buying, selling, trading, or operating at a card show. Detailed management, editing, exports, reporting, and marketplace administration should remain primarily within the dealer dashboard.

Primary Phase 1 objective

A dealer should be able to open a daily log, record a purchase, sale, trade, or related expense, review current inventory, and check basic performance without unnecessary steps or distractions. Reliability and speed should take priority over feature volume.

3. Cross-Platform Structure and Standards

The app and dealer dashboard should function as two views of the same operating system. They should use the same records, definitions, statuses, and calculations so that activity entered on one platform is immediately reflected on the other.

Consistent terminology and data

- Use the same terms for Revenue, Cost, Profit, Profit Margin, Cost Basis, Market Value, List Price, and Sale Price across both platforms.
- Use the same transaction types: Purchase, Sale, Trade, and Expense.
- Use the same daily logs, event names, payment methods, inventory records, and marketplace connection statuses.
- Ensure purchases, sales, trades, and expenses recorded in the app update the dealer dashboard without duplicate entry.

Different roles for each platform

- Mobile app - fast entry, quick inventory access, active daily log management, and basic performance review while the dealer is working.
- Dealer dashboard - detailed editing, filtering, listing administration, full transaction review, report generation, exports, and account management.

Scope discipline

- Remove Phase 1 features that are not essential to the core workflow or cannot be supported reliably.
- Do not present AI, advanced analytics, task management, unsupported integrations, or speculative recommendations as available functionality.
- Retain the dark visual system and align typography, button treatment, labels, and status colors with the dealer dashboard.

4. Recommended Mobile Navigation

The primary bottom navigation should remain limited to five destinations:

- Home - active daily log, fast purchase and sale entry, expense entry, and current activity summary.
- Inventory - mobile access to current card holdings and individual card records.
- Buy - emphasized center action for recording a new card purchase quickly.
- Reports - basic performance check for the current day or selected period.
- More - account, confirmed integrations, payment methods, support, legal information, and sign out.

Sell, Trade, and Expense should remain readily available from Home and from relevant inventory records. They do not each require a permanent navigation tab.

5. Home**Purpose**

The Home screen should function as a quick-entry command center. It should allow a dealer to record activity immediately without being overwhelmed by analytics, scrolling cards, or secondary product features.

Recommended structure

- Display a compact active daily log at the top of the screen. Show the log title, open status, basic totals, and an option to open or close the log.
- Keep the large Buy and Sell buttons as the primary visual actions.
- Add a smaller Add Expense action directly beneath Buy and Sell. Expenses should automatically attach to the active daily log or event when one is open.
- Show a compact current-log summary containing Money In, Money Out, Profit, Cards Bought, and Cards Sold.
- Show only the most recent activity entries, with a link to the complete transaction history when needed.

Daily log behavior

- Allow the dealer to open a named log such as Chicago Sports Spectacular and keep it active throughout the operating day.
- Automatically assign purchases, sales, trades, and expenses to the active log.
- Allow optional Starting Cash and display a simple expected cash amount while the log remains open.
- Generate a concise closing summary when the log is closed. The detailed records should remain available in Transactions on the dealer dashboard.

Remove from Phase 1 Home

- AI Insight cards and player recommendations.
- Ask RSL or other AI assistant actions.
- The inventory preview section, which duplicates the dedicated Inventory screen.
- Horizontally scrolling metric cards that require the dealer to search for basic information.
- Duplicate Buy actions beyond the large Home action and the intentional center navigation button.

Acceptance criteria

- The dealer can identify the active log and record a purchase or sale within seconds of opening the app.
- The Home screen remains concise and does not require extensive scrolling for its core functions.
- No unconfirmed AI or analytical functionality is displayed on the Phase 1 Home screen.

6. Inventory

Purpose

The mobile Inventory screen should provide quick access to the same inventory records maintained in the dealer dashboard. It should be optimized for viewing and selecting cards while the dealer is working, rather than reproducing the dashboard's full table and filtering system.

Recommended mobile presentation

- Use a compact summary showing Total Cards, Cost Basis, Market Value, Unrealized Gain or Loss, and Gain Percentage.

- Display inventory as a scrollable card list rather than a wide desktop-style table.
- Each record should show a card image, player and card name, year, manufacturer and set, grade, cost basis, estimated market value, gain or loss, and listed status.
- Tapping a card should open the full record, including purchase information, listing status, notes, and available transaction actions.

Add Existing Card

Rename the current + Add action to Add Existing Card. This workflow should be used only when entering a card the dealer already owns without recording a new purchase. The Buy workflow should remain the method for acquiring a card and creating the corresponding transaction and cost basis.

Trade workflow

Trade should be a core transaction type. The workflow should remain simple to the dealer while updating Inventory and Transactions together.

- Cards Given - select one or more cards leaving inventory, with current cost basis and an optional agreed trade value.
- Cards Received - add one or more cards entering inventory, with basic card information and an optional agreed trade value.
- Cash Difference - optionally record cash paid or received and the applicable payment method.
- Event Information - automatically use the active daily log when one is open; otherwise allow date, location, and notes.
- Completion - mark cards given as traded, add cards received to inventory, record the trade in Transactions, and calculate the new cost basis consistently behind the scenes.

The app should not expose complicated accounting calculations during the trade workflow. The dealer should be able to understand what left inventory, what entered inventory, and whether cash changed hands.

Acceptance criteria

- Inventory values and statuses match the dealer dashboard.
- Buy, Add Existing Card, Sell, and Trade remain distinct workflows.
- A trade updates both inventory records and transaction history without duplicate entry.

7. Reports

Purpose

The mobile Reports screen should provide a quick performance check during the day. It should not reproduce the full report-generation and export capabilities of the dealer dashboard.

Recommended information

- Revenue.
- Cost.
- Profit.
- Profit Margin.

Time periods

- Today.
- 7 Days.
- 30 Days.
- Year to Date.

Today view

The Today view may also show a compact operational summary containing Cards Bought, Cards Sold, Expenses Recorded, and the active daily log or event. A small revenue-versus-cost visual may be included only if it remains easy to read and does not create additional clutter.

Remove from Phase 1 Reports

- AI Summary and AI-generated performance commentary.
- Advanced analytics, permanent charts, player insights, inventory aging, and platform analysis.
- Monthly report generation, event report downloads, and export controls. These functions should remain on the dealer dashboard.

Acceptance criteria

- A dealer can understand current performance at a glance without navigating through multiple report views.
- All financial terms and calculations match the dealer dashboard.
- The screen remains a quick review tool rather than a detailed accounting or analytics page.

8. More and Settings**Purpose**

The More screen should operate as a basic utility menu. It should not become an additional dashboard or contain analytics, operational modules, or advanced customization.

Recommended Phase 1 menu

- Account - name or business name, email, profile image, password, and account security.
- Marketplace Connections - connect, disconnect, and view the status of confirmed integrations only.
- Payment Methods - manage the payment methods available when recording transactions, including Cash, Card, Venmo, PayPal, Zelle, Check, and Other.
- Notifications - limit notifications to reliable events such as a marketplace connection issue, failed listing, or daily log left open.
- Help and Support - provide a basic support request option and short guidance for Buy, Sell, Trade, Expense, and Daily Log workflows.
- Privacy and Terms.
- Sign Out.

Remove from Phase 1 More screen

- Customers as a separate app module.

- Card Shows as a separate management section. Show and event activity should be handled through Daily Logs.
- My Listings unless reliable mobile listing management is confirmed for launch. Detailed listing administration should remain on the dealer dashboard.
- Data exports, which should remain on the dealer dashboard.
- AI, analytics, tasks, team access, listing defaults, sports preferences, and appearance customization.
- Unsupported or planned marketplace integrations. Only confirmed connections should be displayed.

Acceptance criteria

- Every visible menu item controls a confirmed Phase 1 function.
- The screen remains short, understandable, and consistent with the simplified dashboard Settings structure.
- No menu item implies a capability that is not operational at launch.

9. Core Transaction Workflows

The app should use short, consistent entry forms designed for use during a busy card show. The default form should request only essential information, with optional fields placed under More Details.

Purchase

- Record the card, purchase amount, payment method, source or seller, date and time, and active daily log.
- Add the card to Inventory and establish its cost basis automatically.

Sale

- Select the inventory card, record the sale amount and payment method, and assign the active daily log.
- Mark the card as sold and calculate realized profit automatically.

Trade

- Record cards given, cards received, and any cash difference.
- Update Inventory and Transactions together.

Expense

- Record a category, amount, payment method, and optional note.
- Use simple categories such as Show Fee, Shipping, Grading, Marketplace Fee, Supplies, Travel, and Other.
- Automatically associate the expense with the active daily log or event.

10. Implementation Priorities

Priority 1 - Reduce scope and align structure

- Remove AI Insight, Ask RSL, AI Summary, and other unconfirmed AI functionality.

- Establish the simplified Home, Inventory, Reports, and More screen purposes described in this report.
- Align all terminology, calculations, transaction categories, and statuses with the dealer dashboard.
- Remove menu items and integrations that are not part of the confirmed Phase 1 product.

Priority 2 - Complete reliable operating workflows

- Build and test named daily logs, including opening, active use, optional Starting Cash, and closing summary.
- Complete Purchase, Sale, Trade, and Expense workflows and confirm that each updates the dealer dashboard correctly.
- Implement Add Existing Card as a separate inventory workflow.
- Verify inventory values, profit calculations, and report totals across both platforms.

Priority 3 - Refine usability and polish

- Tighten spacing and reduce unnecessary scrolling on Home and More.
- Standardize buttons, cards, typography, status colors, and empty states with the dealer dashboard.
- Use clear onboarding prompts when no log, inventory, or transactions exist.
- Test the application under real card-show conditions, including rapid entry, weak connectivity, interrupted sessions, and repeated transactions.

11. Conclusion

The current mobile application has an appropriate visual direction, but its Phase 1 value will depend on simplicity and dependable execution. The app should not attempt to replace the dealer dashboard or introduce additional intelligence, analytics, and management features before the core operating workflows are stable.

A focused mobile product centered on daily logs, purchases, sales, trades, expenses, inventory access, and quick performance review will give dealers a practical tool during active business operations. Maintaining consistent data and terminology with the dealer dashboard will also make the broader RSL Cards platform feel connected and intentional.
